# **Summary**

Cardiac units is a specialized units where seriously ill patients are treated by the most highly qualified staff, therefore it needs specialized competent nursing personnel to provide better nursing care for the patients and save them from further complications. It is a fact that there is a lack in specialized nurses, consequently there is a need for inservice education programmes for nurses to improve their practice and to update their knowledge according to the rapid advancement of knowledge and practice.

## **Aim of the study:**

This study aimed to:

Evaluate the effect of an educational program on the performance of nurses working with cardiac patients.

## **Research question/s:**

This study is based on answering the following questions:

- 1- Is there a positive relationship between an educational program for nurses about care of cardiac patients and nurses performance?
- 2- Is there a lack of nurse's knowledge and skills required for care of cardiac patients?

## **Subjects and methods:**

### **Research setting**

This study was conducted in the medical cardiac units , these units are : Intensive care unit ( ICU ) , cardiac department involving the coronary care unit ( CCU ) , cardiac catheter , at Benha University Hospitals in Benha city .

### **Subjects:**

All available nurses (70 nurses), are working at the above – mentioned setting and are caring for the patients with cardiac disorders, with different qualifications.

#### **Tools of data collection:**

- 1- An arabic questionnaire sheet to assess the nurse's knowledge related to the care of patients in medical cardiac units.
- 2- An observation check list to assess the nurse's practice in the same units.
- 3- Likert scale to assess the nurse's attitude toward patients in medical cardiac units.

#### **Results:**

The results of the study showed that:

- The majority of nurse's ages were amonge the age group between (20-30 years).
- In relation to level of education, it was found that the majority of nurses were having diploma in nursing.
- As regard to marital status, the present study indicated that two third of them were married.
- According to years of experience, it was found that nearly three quarter were  $5 \le 7$  years.
- Regarding training program, it was found that the majority of nurses had no training program.
- There were statistically significant difference between pre and post program implementation regarding nurse's knowledge working with cardiac patients.

- There were an improvement in nurse's practice between pre and post program implementation.
- There were a significant differences pre and post program implementation in relation to nurse's attitude toward care of cardiac patients .
- There were no statistical significant differences found between knowledge, attitude, practice, nurse's ages, level of education and years of experience pre / post program implementation.
- There were a statistical significant differences pre and post program implementation between nurse's knowledge and attending a previous training program.
- There were no correlation between pre and post program implementation regarding age, level of education and years of experience with total knowledge score, practice score and attitude score.
- There were significant correlation coefficients between studied nurse's knowledge scores and attending training program, while there were no correlation between nurse's practice score and attitude score and attending training program pre and post program implementation.

#### **Conclusion:**

After the application of an educational program proved that , nurse's knowledge , attitude and practice toward the care of patients with cardiac diseases improved significantly post program implementation .

### The most important recommendations are:

- 1- A continuous inservice educational programs should be held for nurses working or dealing with cardiac patients. Regarding nursing care for these patients to revise, a cquire and develop the knowledge, practice and attitude needed to deal with such group of patients.
- 2- Nurses working with cardiac patients should be theoretically prepared with principles of caring for cardiac patients and well trained for the specialized procedures needed for patients care.
- 3- Incentives should be given to nurses working at CCU & ICU to encourage them to tolerate the heavy work.
- 4- Emphasing on monitoring and supervision as important element for service improvement .
