

# Results & Statistical Analysis

---

❖ *Six patients were evaluated few weeks following surgery (lumpectomy).*

- *Three patients out of six showed residual lesions associated by post operative sequelae.*

*Residual lesions were in the form of :-*

- Densely enhancing irregular rim +/- nodulation.*
- Surrounding densely enhancing streaks infiltrating the surrounding parenchyma*
- S/I curve with malignant criteria.*
- *Two patients out of six showed post operative complications, with no residual lesions, in the form of seroma & hematoma.*
- *One patient out of six showed post operative changes with no complications or residual lesions. Post operative changes are in the form of distorted parenchymal architecture, thickened distorted overlying skin, retracted nipple & faintly enhancing parenchymal strands.*

❖ *Nine patients were evaluated about 18 months following operation & irradiation therapy.*

- *One patient out of nine showed residual lesion in the form of ill defined lesion with intense clumped enhancement & S/I curve & enhancement pattern with malignant criteria.*

## *Results & Statistical Analysis*

---

- *Eight patients out of nine showed complete response in the form of:-*

*→ Seven patients had fibrosis at the operative bed (faintly enhancing strandy tissue).*

*→ One patient showed fairly defined area of diffuse faint enhancement at the operative bed with benign enhancement pattern & S/I curve.*

### *❖ Four patients were evaluated 9-12 months following operation (lumpectomy), irradiation & chemotherapy.*

- *All patients showed complete response.*
- *Two patients showed fibrosis & fat necrosis.*
- *One patient showed post irradiation necrosis (faint enhancing rim).*

### *❖ Seven patients were evaluated following chemo & irradiation therapy*

- *Four patients out of seven were evaluated 3 then 9 months following therapy*

*→ First evaluation showed residual mass with malignant criteria & enhancement pattern.*

*→ Second evaluation showed favorable response in the form of decrease size of the lesion & benign enhancement criteria.*

- *Two patients were evaluated 9 months following therapy:-*

*→ One patient showed complete response in the form of ill defined area of parenchymal distortion, faintly enhancing with benign S/I curve criteria.*

## *Results & Statistical Analysis*

---

→ *The other patient showed partial response in the form of residual mass with malignant criteria, enhancement pattern & S/I curve.*

❖ ***Four patients were evaluated 6-9 months following only chemotherapy***

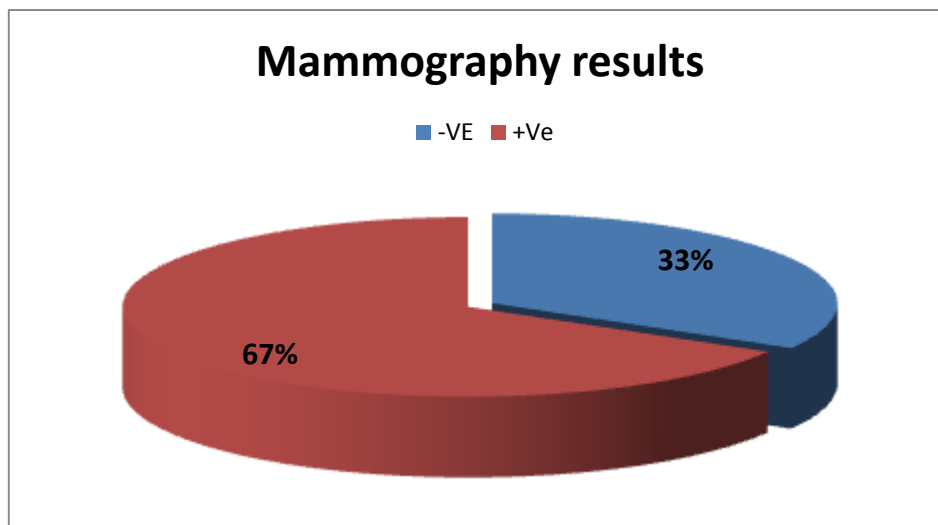

- *One patient out of four was evaluated twice, 6 then 9 months following therapy & showed residual mass with malignant criteria & enhancement pattern.*
- *Three patients were evaluated 9 months following therapy & showed response to therapy in the form of necrosis.*
