

## RESULTS

This study was done at Chest Out Patient Clinic of Benha University hospital, Benha Chest hospital and Microbiology & Immunology Department of Benha Faculty of Medicine from January to June (2010) on 50 patients (37 males and 13 females). Their age ranged from 18-67 years. The selection of patients was done according to clinical and radiological data suspecting pulmonary tuberculous infections. Patients were classified into two groups:

**I- Twenty nine patients with no history of antituberculous treatment**

**II- Twenty one patients receiving rifampicin:** those patients were subdivided into 2 subgroups:

- 1- Thirteen patients starting antituberculous treatment with no problems.
- 2- Eight patients with previous history of failed antituberculous treatment.

The collected sputum samples were subjected to ZN stain; out of 50 studied patients 42 (84%) and 8 (16%) were ZN smear positive and negative respectively.

Out of those 42 (84%) ZN smear positive patients, 25 (59.5%) were not receiving any antituberculous treatment, 17 (40.5%) were under antituberculous treatment including rifampicin for more than 2 months. While out of 8 (16%) smear negative patients 4 (50%) had no history of antituberculous treatment and the other 4 (50%) were under antituberculous treatment including rifampicin.

All 50 studied sputum samples from 50 studied patients were positive for FDA/EB stain.

The age of patients under study ranged from 15 to 67 years old  $33.4 \pm 12.4$ . There were 5 (10%) cases in age group  $10 \leq 20$  years, 18 (36%) cases in age group  $20 \leq 30$  years, 15 (30%) cases in age group  $30 \leq 40$  years, 7(14%) patients in age group  $40 \leq 50$  years, 3 (6%) patients in age group  $50 \leq 60$  years and 2(4%) cases in age group  $60 \leq 70$  years.

**Table (1):Distribution of tuberculosis among different age groups of the studied patients:**

| <b>Age groups / years</b> | <b>No</b> | <b>%</b> |
|---------------------------|-----------|----------|
| <b>10- ≤20</b>            | 5         | 10%      |
| <b>20- ≤30</b>            | 18        | 36%      |
| <b>30- ≤40</b>            | 15        | 30%      |
| <b>40- ≤50</b>            | 7         | 14%      |
| <b>50- ≤60</b>            | 3         | 6%       |
| <b>60- ≤70</b>            | 2         | 4%       |
| <b>Total</b>              | 50        | 100%     |

Table (1): shows that the highest rate of tuberculosis was 18 (36%) out of 50 cases in the age group 20- ≤30.

**Figure (1) Distribution of tuberculosis among different age groups of the studied patients:**

**Table (2): Distribution of tuberculosis according to sex of the studied patients:**

| <b>Sex</b>    | <b>No</b> | <b>%</b> |
|---------------|-----------|----------|
| <b>Male</b>   | 37        | 74%      |
| <b>Female</b> | 13        | 26%      |
| <b>Total</b>  | 50        | 100%     |
| <b>Z</b>      | 4.8       |          |
| <b>P</b>      | <0.05     |          |

Table (2): shows that out of 50 patients; 37 (74%) were males and 13 (26%) were females.

There is a significance statistical difference ( $p < 0.05$ ) as regards the sex of the studied patients.

**Figure (2) Distribution of tuberculosis according to sex of the studied patients:**

**Table (3): Effect of occupation and smoking habit on the tuberculous infection**

|                              | NO | %    |
|------------------------------|----|------|
| <b>Occupation</b>            |    |      |
| ♦ Workers                    | 31 | 62%  |
| ♦ Housewives                 | 13 | 26%  |
| ♦ Employers                  | 6  | 12%  |
| <b>Smoking habits</b>        |    |      |
| ♦ Cigarette smokers          | 16 | 32%  |
| ♦ Goza smokers               | 14 | 28%  |
| ♦ Cigarette and goza smokers | 6  | 12%  |
| <b>Non smokers</b>           | 14 | 28%  |
| <b>Total</b>                 | 50 | 100% |

Table (3): shows that out of 50 studied patients 31 (62%) were workers, 13 (26%) housewives and 6 (12%) employers.

As regards the effect of smoking habits in tuberculous infection 16 (32%) out of 50 cases under this study were cigarette smokers, 14 (28%) were goza smokers and 6 (12%) were both cigarette and goza smokers.

**Table (4): Results of microscopic examination of ZN stained smear**

| <b>ZN stained smears</b> | <b>NO</b> | <b>%</b> |
|--------------------------|-----------|----------|
| <b>Positive</b>          | 42        | 84%      |
| <b>Negative</b>          | 8         | 16%      |
| <b>total</b>             | 50        | 100%     |

Table (4): shows that out of 50 ZN stained smear from 50 studied patients 42 (84%) were ZN positive and 8 (16%) were ZN negative.

**Table (5): Results of microscopic examination of Fluorescein diacetate ethidium bromide (FDA/EB) stained smear**

| <b>FDA/EB stained smears</b> | <b>NO</b> | <b>%</b> |
|------------------------------|-----------|----------|
| <b>Positive</b>              | 50        | 100%     |
| <b>Negative</b>              | 0         | 0        |
| <b>total</b>                 | 50        | 100%     |

Table (5): shows that all 50 studied sputum samples from 50 studied patients were positive for FDA/EB stain

**Figure(3): FDA/EB stained smear shows that FDA stained viable *M.TB.* bacilli (greenish yellow) while EB stained dead *M.TB.* bacilli (red) as examined by fluorescent microscope (400x)**

**Table (6): Results of microscopic examination of FDA/EB stained smear**

| FDA/EB stained smears | Viable |    | Dead |   | Viable and dead |    | Total |     |
|-----------------------|--------|----|------|---|-----------------|----|-------|-----|
|                       | NO     | %  | NO   | % | NO              | %  | NO    | %   |
|                       | 23     | 46 | 4    | 8 | 23              | 46 | 50    | 100 |

Table (6): Shows that out of 50 FDA/EB stained smear from 50 studied patients 23 (46%) showed viable bacilli, 4 showed dead bacilli and 23 (46%) showed both viable and dead bacilli.

**Table (7): Grades of microscopic examination of 50 ZN stained sputum smears from 50 studied patients**

| <b>ZN stained smears</b> | <b>NO</b> | <b>%</b> |
|--------------------------|-----------|----------|
| <b>Negative</b>          | 8         | 16%      |
| <b>Positive</b>          |           |          |
| <b>1. Grade +</b>        | 10        | 20%      |
| <b>2. Grade ++</b>       | 24        | 48%      |
| <b>3. Grade +++</b>      | 8         | 16%      |
| <b>Total</b>             | 50        | 100%     |

Grades of microscopic examination of ZN stained sputum smear according to (*American Thoracic Society, 1981*)

- Negative: No AFB per 100 fields by oil immersion lens 1000x
- Scanty: 1-9 AFB per 100 fields by oil immersion lens 1000x
- 1+: 10-99 AFB per 100 fields by oil immersion lens 1000x
- 2+: 1-10 AFB per one field by oil immersion lens 1000x
- 3+: more than 10 AFB per one field by oil immersion lens 1000x

**Figure(4): Positive ZN stained smear**  
**Grade (+) according to (*American Thoracic Society, 1981*)**

**Figure(5): Positive ZN stained smear**  
**Grade (+++) according to (*American Thoracic Society, 1981*)**

**Table (8): Grades of microscopic examination of 50 FDA/EB stained sputum smears from 50 studied patients**

| FDA/EB stained smears |              | Total |      |
|-----------------------|--------------|-------|------|
| Viable bacilli        | Dead bacilli | NO    | %    |
| -                     | +            | 4     | 8%   |
| scanty                | ++           | 8     | 16%  |
| +                     | +            | 4     | 8%   |
| +                     | -            | 2     | 4%   |
| ++                    | +            | 12    | 24%  |
| ++                    | -            | 10    | 20%  |
| +++                   | -            | 10    | 20%  |
|                       |              | 50    | 100% |

Grades of microscopic examination of FDA/EB stained sputum smears according to (*Nakamura and Kinomoto, 1990*):

- Negative: No AFB per 100 oil immersion field (400x)
- Scanty: 1-9 AFB per 100 fields (400x)
- 1+: 10-99 AFB per 100 fields(400x)
- 2+: 1-10 AFB per individual field(400x)
- 3+: 10 to 100 AFB per individual field (400x)

**Table (9): Results of FDA versus ZN stained sputum smears from 50 studied patients.**

| FDA stain=46 samples | ZN       |          | Total |
|----------------------|----------|----------|-------|
|                      | Positive | Negative |       |
| <b>Positive</b>      | 42       | 4        | 46    |
| <b>Negative</b>      | 0        | 4        | 4     |
| <b>Total</b>         | 42       | 8        | 50    |

Table (9): shows that out of 50 sputum samples 42 were positive by FDA and ZN stains, 4 samples were positive and negative by FDA and ZN stains respectively while 4 were negative by both .

**For FDA stain.**

Sensitivity = 100%

Specificity = 50%

PPV =91.3%

NPV=100%

**Table (10): LJ culture results of 50 studied sputum samples**

| <b>LJ culture</b> | <b>NO</b> | <b>%</b> |
|-------------------|-----------|----------|
| <b>Positive</b>   | 46        | 92%      |
| <b>Negative</b>   | 4         | 8%       |
| <b>Total</b>      | 50        | 100%     |

Table (10): shows that out of 50 sputum samples 46 (92%) samples showed growth on LJ medium while 4 (8%) had no growth.

**Figure(6): Mycobacterial growth on LJ medium**

**Colonies are rough, yellow and cauliflower**

**Table (11): Results of Z.N stain versus L.J culture for detecting acid fast bacilli in sputum samples.**

| Z.N stain    | L.J culture |      | Total |
|--------------|-------------|------|-------|
|              | + ve        | - ve |       |
| + ve         | 42          | -    | 42    |
| - ve         | 4           | 4    | 4     |
| <b>Total</b> | 46          | 4    | 50    |

Table (11): shows that out of 50 sputum samples 42 were positive for tuberculosis by both Z.N stain and culture on LJ media, 4 were negative by both methods and 4 were negative by Z.N

**For Z.N stain:**

Sensitivity = 91.3%

Specificity = 100%

Positive Predictive value = 100%

Negative predictive value = 100%

**Table (12): Results of FDA stain (viability stain) versus LJ culture method for sputum samples of 50 studied patients.**

| FDA stain | LJ culture |          | Total |
|-----------|------------|----------|-------|
|           | Positive   | Negative |       |
| Positive  | 46         | —        | 46    |
| Negative  | —          | 4        | 4     |
| Total     | 46         | 4        | 50    |

Table (12): shows that out of 50 sputum samples 46 were positive by FDA stain and LJ culture, 4 were negative by both methods.

**For FDA stain.**

Sensitivity = 100%

Specificity = 100%

**Table (13): Results of fast plaque response(TM) assay of 50 studied sputum samples**

| <b>Fast plaque response(TM) assay</b> | <b>NO</b> | <b>%</b> |
|---------------------------------------|-----------|----------|
| <b>Positive</b>                       | 35        | 70%      |
| <b>Negative</b>                       | 15        | 30%      |
| <b>Total</b>                          | 50        | 100%     |

Table (13): shows that out of 50 sputum samples 35 (70%) were positive while 15 (30%) were negative by fast plaque response(TM) assay.

**Figure (8): Results of fast plaque response(TM)  
assay of 50 studied sputum samples**

**Figure(8): Positive fast plaque response(TM) assay**

**Figure(9): Negative fast plaque response(TM) assay**

**Table (14): Results of fast plaque response(TM) assay of 50 studied sputum samples versus LJ culture.**

| fast plaque response (TM) assay | LJ culture |          | Total |
|---------------------------------|------------|----------|-------|
|                                 | Positive   | Negative |       |
| <b>Positive</b>                 | 35         | —        | 35    |
| <b>Negative</b>                 | 11         | 4        | 15    |
| <b>Total</b>                    | 46         | 4        | 50    |

Table (14): shows that out of 50 sputum samples 35 were positive by Fast plaque assay and LJ culture, 4 were negative by both methods and 11 were negative by Fast plaque assay .

**For Fast plaque assay .**

Sensitivity = 76.1%

Specificity = 100%

Positive Predictive value = 100%

Negative predictive value = 26.7%

**Table (15): Time of isolation of mycobacterial isolates of 50 studied sputum samples by LJ culture and Fast plaque response(TM) assay**

| <b>Time / days</b>           | <b>LJ culture</b> | <b>Fast plaque response(TM) assay</b> |
|------------------------------|-------------------|---------------------------------------|
| <b>Range</b>                 | 22-41 days        | 2 days                                |
| <b>Mean</b>                  | 27.5              | 2                                     |
| <b>S.D. <math>\pm</math></b> | 9.59              | -                                     |
| <b>S.E. <math>\pm</math></b> | 1.35              | -                                     |

S.D: Standered deviation

S.E: Standered error

**Table (16): Number of *M.TB.* and MOTT strains isolated on LJ culture medium:**

| LJ culture |      | <i>M.TB.</i> |       | MOTT |       |
|------------|------|--------------|-------|------|-------|
| NO         | %    | NO           | %     | NO   | %     |
| 46         | 100% | 41           | 89.1% | 5    | 10.9% |

*M.TB.*: mycobacterium tuberculosis

**MOTT**: mycobacterium other than tuberculosis

By using niacin production and nitrate reduction tests; out of 46 mycobacterial isolates, 41 (89.1%) were biochemically typed as being *M. tuberculosis* whereas the other 5 (10.9%) were typed as MOTT.

**Figure(10): NIACIN TEST**

"P" positive : Yellow color

"N" negative: No color

**Figure(11): NITRATE REDUCTION TEST**

- "P" positive : a blue color in the top portion of the strip.
- "N" negative: No color

**Table (17):Relation between Z.N stain results and antituberculous drug intake including rifampicin:**

| Antituberculous drug<br>intake             | Z.N stain |      |          |      | Total |     | Z   | p     |
|--|-----------|------|----------|------|-------|-----|-----|-------|
|  | positive  |      | negative |      |       |     |     |       |
|  | NO        | %    | NO       | %    | NO    | %   |     |       |
| No history of<br>antituberculous treatment | 25        | 86   | 4        | 14   | 29    | 100 | 0.5 | >0.05 |
| Antituberculous treatment                  | 17        | 80.9 | 4        | 19.1 | 21    | 100 |     | NS    |
| ♦ Antituberculous treatment<br>response    | 9         | 69.2 | 4        | 30.8 | 13    | 100 | 1.7 | >0.05 |
| ♦ Antituberculous treatment<br>failure     | 8         | 100  | -        | -    | 8     | 100 |     | NS    |
| Total                                      | 42        | 84   | 8        | 16   | 50    | 100 |     |       |

Table (17): shows there is insignificant statistical difference ( $P>0.05$ ) between the results of ZN stained smear in both patients with no history of antituberculous treatment and patients under treatment.

**Table (18): Relation between the diagnosis of tuberculous infection by FDA/EB stain method and antituberculous drug intake including rifampicin:**

| Antituberculous drug<br>intake             | FDA/EB stain method |       |      |      |      |       | Total |     |
|--|---------------------|-------|------|------|------|-------|-------|-----|
|  | Viable              |       | Dead |      | Both |       |       |     |
|  | NO                  | %     | NO   | %    | NO   | %     | NO    | %   |
| No history of<br>antituberculous treatment | 20                  | 68.97 | -    | -    | 9    | 31.03 | 29    | 100 |
| Antituberculous treatment                  | 3                   | 14.3  | 4    | 19.1 | 14   | 66.6  | 21    | 100 |
| ♦ Antituberculous treatment<br>response    | -                   | -     | 4    | 30.8 | 9    | 69.2  | 13    | 100 |
| ♦ Antituberculous treatment<br>failure     | 3                   | 37.5  | -    | -    | 5    | 62.5  | 8     | 100 |
| Total                                      | 23                  | 46    | 4    | 8    | 23   | 46    | 50    | 100 |

Table (18): shows that by FDA/EB stain method 20 patients (68.97%) with no history of antituberculous treatment had viable bacilli while 3 (37.5%) with history of antituberculous treatment failure had viable bacilli. There is 4 (19.1%) patients had dead bacilli among those had history of antituberculous treatment. While in patients with no history of antituberculous treatment no one had dead bacilli.

**Table (19):Relation between LJ culture results and antituberculous drug intake including rifampicin:**

| Antituberculous drug intake             | LJ culture |      |          |      | Total |     | Z   | p           |

**S= significant**

**NS=non significant**

Table (19): shows that there is significant statistical difference ( $P<0.05$ ) as regards the diagnosis of tuberculous infection by LJ culture method among patients with no history of antituberculous treatment . While, there is insignificant statistical difference ( $P>0.05$ ) as regards the diagnosis of tuberculous infection by LJ culture method among patients under antituberculous treatment .

**Table (20):Relation between the diagnosis of tuberculous infection by Fast plaque response(TM) assay and antituberculous drug intake including rifampicin:**

| Antituberculous drug<br>intake             | Fast plaque response<br>(TM) assay |      |          |      | Total |     | Z    | p         |
|--|------------------------------------|------|----------|------|-------|-----|------|-----------|
|  | positive                           |      | negative |      |       |     |      |           |
|  | NO                                 | %    | NO       | %    | NO    | %   |      |           |
| No history of<br>antituberculous treatment | 26                                 | 89.7 | 3        | 10.3 | 29    | 100 | 2.01 | <.05<br>S |
| Antituberculous treatment                  | 9                                  | 42.9 | 12       | 57.1 | 21    | 100 |      |           |
| ♦ Antituberculous treatment<br>response    | 1                                  | 7.7  | 12       | 92.3 | 13    | 100 | 4.2  | <.05<br>S |
| ♦ Antituberculous treatment<br>failure     | 8                                  | 100  | -        | -    | 8     | 100 |      |           |
| Total                                      | 35                                 | 70   | 15       | 30   | 50    | 100 |      |           |

Table (20): shows that the diagnosis of tuberculous infection by Fast plaque assay was higher among patients who had no history of antituberculous treatment than those under antituberculous treatment with significant statistical difference( $P<0.05$ ).

**Table (21): Relation between the demographic data of tuberculous patients and Rifampicin resistance :**

\* D.M: Diabetes mellitus

There is a significant statistical difference as regards the relation of D.M and rifampicin resistance among tuberculous patients. There are insignificant statistical differences in the relation between history of TB, pulmonary TB cavitation, history of pulmonary TB only and history of contact with T.B case with rifampicin resistance results.

**Table (23): Relation between the rifampicin resistance pattern of *M.TB* isolates and severity of disease**

| Rifampicin<br>Resistance | Severity of disease |      |          |      |          |      | Total |
|--------------------------|---------------------|------|----------|------|----------|------|-------|
|                          | Minimal             |      | Moderate |      | Advanced |      |       |
|                          | No                  | %    | No       | %    | No       | %    |       |
|                          | 2                   | 11.8 | 4        | 23.6 | 11       | 64.7 |       |

Table (23): shows that out of 17 rifampicin resistant tuberculous patients 2(11.8%) had minimal, 4(23.6%) moderate and 11(64.7%) advanced clinical condition

**Table (24) Number of plaques in plates with and without rifampicin**

| Number of<br>plaques without<br>rifampicin | Number of<br>plaques with<br>rifampicin | Interpretation           | Total |     |
|--|---|--------------------------|-------|-----|
|  |   |                          | NO    | %   |
| >300                                       | >50                                     | Resistance to rifampicin | 5     | 10  |
| >100                                       | >50                                     | Resistance to rifampicin | 12    | 24  |
| >100                                       | <50                                     | Sensitive to rifampicin  | 18    | 36  |
| <100                                       | <50                                     | Absence of TB bacilli    | 15    | 30  |
| Total                                      |   |                          | 50    | 100 |

**According to Albert et al., 2002:**

The number of plaques in plates without rifampicin (RIF-)

- >100 plaques is considered positive
- >300 plaques is considered strong positive

The number of plaques in plates with rifampicin (RIF+)

- >50 plaques is considered resistant to rifampicin
- <50 plaques is considered sensitive to rifampicin

**Figure (12): Rifampicin sensitive *M.TB***

The plate on the left, free from rifampicin: contain >100 plaques

The plate on the right with rifampicin: contain no plaques

**Figure (13): Rifampicin resistant *M.TB***

The plate on the left, free from rifampicin: contain >100 plaques

The plate on the right with rifampicin: contain >50 plaques

**Table (25): Rifampicin resistance using fast plaque response (TM) assay.**

| Rifampicin resistant |    | Rifampicin susceptible |    | Total |     |
|----------------------|----|------------------------|----|-------|-----|
| NO                   | %  | NO                     | %  | NO    | %   |
| 17                   | 34 | 33                     | 66 | 50    | 100 |

Table (25): shows that out of 50 studied sputum samples; 17 (34%) mycobacterium isolates were rifampicin resistant and 33(66%) were rifampicin susceptible.

**Figure(15) Rifampicin resistance using fast  
plaque response(TM) assay**

**Table (26): Primary and secondary rifampicin resistance among mycobacterium isolates**

| Primary rifampicin resistance |       | Secondary rifampicin resistance |       | Total |     |
|-------------------------------|-------|---------------------------------|-------|-------|-----|
| NO                            | %     | NO                              | %     | NO    | %   |
| 9                             | 52.9% | 8                               | 47.1% | 17    | 100 |

Table (26): shows that out of 17 rifampicin resistant mycobacterium isolates, 9 (52.9%) had primary rifampicin resistance and 8 (47.1%) had secondary rifampicin resistance.
