

Extract the study in Arabic

As a result of the rapid developments of information and communication technology and the subsequent growth of the growing of the Internet; many sources of electronic information had been generated , researchers found themselves in front of a new reality to be dealt with but also must acquire a set of skills, search and retrieval mechanism that would enable them to navigate in the world of the Internet and take advantage of these sources; and then appeared the search engines That have contributed to an active role in this. However, the extreme diversity of the sources of electronic information was the motive to appear several kinds of university portals which consider the most important kind of web portal, so this study concentrates on Mansoura University portal.

The study divided into seven chapters. The first one tracked the different stages of the emergence of portals, in addition to the definition of portals by offering several definitions of Arab and foreign ones. After that the chapter dealt with the different types of portals and focused at the institutional and educational portals, and then university portals. The second chapter deals with a description and analysis of this structure through the application of a set of criteria. The third chapter highlights on the centre of communications and information technology. The fourth chapter highlights the most available electronic systems through the portal of the University of Mansoura. The fifth chapter deals with the goal of creating electronic systems in Mansoura University, deals with the executive steps to create, and then design and programming, as well as experimentation and testing, training on these systems, maintenance, and others. Chapter six deals with the emergence of saving documents system in Mansoura University, and implementation steps and stages, through the importance of the system, and its components, and functions, and continuing to talk about the system database, and how to classify (organize) the contents of the system, and the search strategy used. Finally the researcher limits a set of criteria that has applied to the system to indicate whether it perform its duties to the fullest, or not? The focus of the researcher in this chapter on the functional aspects of the system without addressing the technical and technological aspects used in the design, the important thing here is to know the functional components to it.

Chapter seven deals with two systems were adding recently to the future management of libraries system university studies and faculty member's researches. The researcher will deal with these two systems in some detail in terms of objectives, components, functions, and operations of search and retrieval, and others.
