

RESULTS

RESULTS

* Tables (1), (2), (3) and (4) show the clinical and laboratory data in the different groups in the present work.

* Table (5) shows the plasma antithrombin III level among the studied groups. There is a significant decrease in AT III level in uremic patients with regular hemodialysis before session as compared to the control group. There is no significant decrease in AT III level in uremic patients with regular hemodialysis after session as compared to the control group. There is a significant decrease in AT III level in uremic patients with conservative treatment as compared to the control group.

* Table (6) shows partial thromboplastin time among the studied groups. There is a significant increase in partial thromboplastin time in uremic patients with regular hemodialysis before and after session as compared to the control group. There is a significant increase in partial thromboplastin time in uremic patient with conservative treatment as compared to the control group.

* Table (7) shows platelet count among the studied groups. There is a significant decrease in platelet count in uremic patients with regular hemodialysis before and after session as

compared to the control group. There is no significant decrease in platelet count in uremic patients with conservative treatment as compared to the control group.

* Table (8) shows value of antithrombin III, partial thromboplastin time and platelet count before and after session among uremics under regular dialysis. There is a significant increase in AT III level after session. There is no significant decrease in partial thromboplastin time after session. There is no significant decrease in platelet count after session.

* Table (9) represents the correlation coefficient and probability value between AT III versus partial thromboplastin time and platelet count among studied groups. There is no significant negative correlation between AT III and partial thromboplastin time among the studied groups. There is no significant positive correlation between AT III and platelet count among the studied groups.

* Table (10) represents the correlation coefficient and probability value between AT III versus partial thromboplastin time and platelet count among uremic patients with regular hemodialysis before session. There is no significant negative correlation between AT III and partial thromboplastin time among the uremic patients with regular hemodialysis before session. There is no significant positive correlation between AT III and platelet count among uremic patients with regular hemodialysis before session.

* Table (11) represents the correlation coefficient and probability value between AT III versus partial thromboplastin time and platelet count among uremic patients with regular hemodialysis after session. There is no significant positive correlation between AT III and partial thrombo plastin time among uremic patients with regular hemodialysis after sessiion. There is no significant correlation between AT III and platelet count among uremic patients with regular hemodialysis after session.

* Table (12) represents the correlation coefficient and probability value between AT III versus partial thromboplastin time and platelet count among uremic patients with conservative treatment. There is no significant negative correlation between AT III and partial thromboplastin time among uremic patients with conservative treatment. There is no signicicant positive correlation between AT III and platelet count among uremic patients with conservative treatment.

* Table (13) shows serum creatinine among the studied groups. There is a significant increase in serum creatinine in uremic patients with regular hemodialysis before session as compared with control group. There is a significant increase in serum creatinine in uremic patients with regular hemodialysis after session as compared with control group there is a significant increase in serum creatinine in uremic patients with conservative treatment as compared with control group.

* Table (14) shows blood urea among the studied groups. There is a significant increase in blood urea in uremic patients with regular hemodialysis before session as compared with control group. There is a significant increase in blood urea in uremic patients with regular hemodialysis after session as compared with control group. There is a significant increase in blood urea in uremic patients with conservative treatment as compared with control group.

* Table (15) shows sex distribution of the studied groups.

* Table (16) shows age distribution of the studied groups.

Table (1): Clinical and Laboratory data of control group

	Sex	Age (y)	AT III (mg/dl)	PTT (sec.)	Plat. count (1000/cmm)	Urea (mg/dl)	Creatinine (mg/dl)
1	M	25	244	30	250	22	0.7
