Demographic and clinical characteristics:

This study was carried out on 75 patients admitted in the urology department in Benha University Hospital together with 15 apparently healthy control subjects: -

Group I:

Included 60 patients with newly diagnosed squamous cell carcinoma of the bladder who were diagnosed by histopathology following cystoscopic biopsy of the tumor. They were 49 males (81.67%) and 11 females (18.33%) with age ranging from 39 – 82 years with a mean of 63.38 ± 10.43 .

Group II:

Included 15 patients with other benign urological conditions (5 cases of urinary tract infection, 3 cases of benign prostatic hyperplasia, 3 cases of stone bladder, 2 cases of stone ureter, one case of stress urinary incontinence and one case of impotence). They were 9 males (60%) and 6 females (40%) with age ranging from 38 – 72 years with a mean of 61.26 ± 8.89 .

Group III:

Included 15 apparently healthy individuals matched in age and sex with the patients groups and they were clinically free from any urological disease. They were 9 males (60%) and 6 females (40%) with age ranging from 39 – 74 years with a mean of 60.33 ± 9.55 .

Table (3) Age of patients among the groups under the study.

Group	Range (years)	Mean \pm SD
Group I (n = 60)	39 – 82	63.38 \pm 10.43
Group II (n = 15)	38 – 72	61.26 \pm 8.89
Group III (n = 15)	39 – 74	60.33 \pm 9.55

Fig. (1): Mean age of patients in the groups under study.

Table (4): Comparison of ages between the different studied groups.

Group	Z value	P value
Group I & group II	1.216	>0.05*
Group I & group III	1.369	>0.05*
Group II & group III	1.112	>0.05*

*No significant difference was encountered in age between each two of the 3 groups.

Table (5): Comparison of ages between the different grades of the tumors in the studied group I.

Item	Grade I (n = 28)	Grade II (n = 18)	Grade III (n = 14)	P value
Mean \pm SD	61.82 \pm 9.83	66.61 \pm 9.82	62.35 \pm 12.08	>0.05*

*No significant difference was encountered in age between the different grades of the tumors in the studied group I.

Table (6): Comparison of ages between the superficial and invasive stages of the tumors in the studied group I.

Item	Superficial stages (n = 36)	Invasive stages (n = 24)	P value
Mean \pm SD	64.13 \pm 9.89	62.25 \pm 11.3	>0.05*

*No significant difference was encountered in age between the superficial and invasive stages of the tumors in the studied group I.

Fig. (2): Sex distribution among studied groups.

Table (7): Urinary creatinine of patients among the studied groups.

Group	Range (mg/dl)	Mean \pm SD
Group I	78 – 174	115.05 \pm 21.5
Group II	98 – 168	121.46 \pm 20.18
Group III	98 – 142	131.86 \pm 13.6

Table (8): Comparison of urinary creatinine between the different studied groups.

Group	Z value	P value
Group I & group II	-1.119	>0.05*
Group I & group III	-3.331	<0.001**
Group II & group III	-1.659	<0.05***

*No significant difference was encountered in urinary creatinine between group I and group II.

**High significant decrease was encountered in urinary creatinine in group I when compared to group III.

***Significant decrease was encountered in urinary creatinine in group II when compared to group III.

The descriptive statistics of NMP22, urinary bladder cancer antigen (UBC) with and without correction by urinary creatinine (expressed by the median, the range, the mean and SD) and urine RBCs among the studied groups are presented in Tables (9, 13, 15) and Figures (3, 4, 5, 6, 7).

Table (9): Descriptive statistics of NMP22, UBC (both with and without correction by urinary creatinine) and urine RBCs among studied groups.

Variant		GROUP I NO.=60	GROUP II NO.=15	GROUP III NO.=15
NMP22 U/ml	Median	120.9	4.8	2.4
	Range	2.1-196.9	1.4-60	0.7-24

***No significant difference was encountered in NMP22 & UBC (both with and without correction) between superficial and invasive stages of the tumors in studied group I.**

By using the **Receiver Operator Characteristic curve (ROC curve)** it was found that:

- At a cutoff value of 7.0 U/ml for NMP22, maximum sensitivity (76.67%) and specificity (80%) was observed differentiating between cases of squamous cell carcinoma of the bladder (**group I**) and other non malignant cases (**group II & group III**).
- At a cutoff value of 7.5 μ g/l for UBC, maximum sensitivity (85%) and specificity (86.67%) was observed differentiating between cases of squamous cell carcinoma of the bladder (**group I**) and other non malignant cases (**group II & group III**).

AUC	
NMP22	0.746
UBC	0.833

Fig. (8): ROC curve for NMP22 and UBC for all subjects under the study with best cutoff values of 7.0 U/ml for NMP22 and 7.5 $\mu\text{g/l}$ for UBC.

- At a cutoff value of 5 U/mg. creatinine for corrected NMP22, maximum sensitivity (83.33%) and specificity (83.33%) was observed differentiating between cases of squamous cell carcinoma of the bladder (group I) and other non malignant cases (group II & group III).
- At a cutoff value of 6 μ g/gm. creatinine for corrected UBC, maximum sensitivity (85%) and specificity (86.67%) was observed differentiating between cases of squamous cell carcinoma of the bladder (group I) and other non malignant cases (group II & group III).

AUC	
NMP22 Creatinine Ratio	0.779
UBC Creatinine Ratio	0.829

Fig. (9): ROC curve for corrected NMP22 and UBC for all subjects under the study with best cutoff values of 5.0 U/mg. creatinine for corrected NMP22 and 6.0 $\mu\text{g/gm.}$ creatinine for corrected UBC.

Critical Value (1 – Tail, 0.05) = + or – 0.44218.

From the previous 3 tables we found that:

- There was positive significant correlation between NMP22 and UBC (both before and after correction by urinary creatinine) among patients in group I.
- There was positive non-significant correlation between NMP22 and UBC (both before and after correction by urinary creatinine) among patients in group II.
- There was negative non-significant correlation between NMP22 and UBC (both before and after correction by urinary creatinine) among healthy subjects in group III.
