

SUMMARY

=====

Stridor is a difficult noisy breathing due to partial laryngeal

Obstruction it begins as inspiratory stridor and later becomes.

Inspiratory and expiratory when obstruction increases, it's a major symptoms in subglottic stenosis.

By careful history and examination can distinguish. Whether causes of stridor is congenital or acquired. Laryngomalacia, Webs, clefts vocal cord paralysis, subglottic stenosis or acquired as foreign bodies or inflammation. If stridor since birth there are cough feeding difficulties, chest infection. But if stridor occurs in a previously healthy child may be acute laryngitis or inhaled foreign body or tumour development as papilloma.
