| ACKNOWLEDGMENT                                       | i    |
| ABSTRACT                                             |      |
| CHAPTER (1)                                          | 1    |
| General introduction                                 | 1    |
| 1.A. Introduction to fusion reaction                 | 1    |
| 1.A.1. Heavy - ion reactions.                        | 4    |
| 1.A.2. Heavy - ion potentials.                       | 5    |
| 1.A.3. The folding model.                            | 7    |
| 1.A.4. Optical model.                                | 9    |
| 1.A.5. Complete fusion.                              | 9    |
| 1.A.6. Sub-barrier fusion.                           | 11   |
| 1.A.7. Fusion above the barrier.                     | 12   |
| 1.B. Introduction to Nuclear and neutron matter .    | 17   |
| 1.B.1. The statistical properties of nuclear system. | 26   |
| 1.B.2. Supernova.                                    | 27   |
| CHAPTER II                                           | 30   |
| METHODS OF CALCULATIONS.                             | 30   |
| 2.A. Types of potentials.                            | 30   |
| 2.A.1. Woods - Saxon potential.                      | 30   |
| 2.A.2. Single folding potential.                     | 31   |

|                                                                      |        |
|----------------------------------------------------------------------|--------|
| 2.A.3. Double folding potential.                                     | 31     |
| 2.A.4. The density dependence.                                       | 34     |
| 2.A.5. Nuclear density.                                              | 35     |
| 2.B.1. Thomas Fermi model at zero temperature<br>for nuclear matter. | 38     |
| Calculation of the kinetic energy.                                   | 41     |
| Calculation of the potential energy.                                 | 41     |
| Neutron matter at zero temperature.                                  | 45     |
| 2.B.2. Nuclear matter at finite temperature.                         | 47     |
| Neutron matter at finite temperature.                                | 50     |
| Degenerate Fermi liquid ( $T^6$ - approximation).                    | 51     |
| 2.B.3. Statistical properties calculation.                           | 53     |
| 2.B.4. Neutron star calculation.                                     | 56     |
| <br>CHAPTER III                                                      | <br>58 |
| Results and discussions.                                             | 58     |
| 3.A. Results of fusion reaction.                                     | 58     |
| 3.B.1. Results of nuclear matter.                                    | 64     |
| 3.B.2. Neutron matter results                                        | 70     |
| 3.B.3. Results of statistical properties.                            | 73     |
| 2.B.4. Results of neutron star structure.                            | 76     |
| <br>Conclusion                                                       | <br>77 |
| Figures caption                                                      | 79     |
| APPENDIX (1)                                                         | 85     |

|                                                           |    |
|-----------------------------------------------------------|----|
| Calculation of potential energy term at zero temperature. | 89 |
| APPENDIX (2)                                              |    |
| Fitting the potential parameters with input properties.   | 91 |
| APPENDIX (3)                                              |    |
| Calculations of the single particle potential.            | 96 |
| APPENDIX (4)                                              |    |
| Calculation of the EOS.                                   | 99 |
