Abstract	i
1 REVIEW OF THEORETICAL MODELS	1
1.1 General review	1
1.2 Main formulae of the Glauber theory	7
1.3 Cascade evaporation model	11
1.4 Andersson – Otterlund – Stenlund model and its generalization	15
1.5 Ranft and <i>VENUS</i> models	18
1.6 Multifragmentation models	20
1.7 Aim of the work	27
2 PARTICLE PRODUCTION AT THE FAST STAGE OF INTERACTION	28
2.1 Reggeon theory of secondary particle cascading into the nucleus	31
2.1.1 Nucleon-nucleon interaction	31
2.1.2 Hadron-nucleus scattering	33
2.1.3 Nucleus-nucleus interactions	37
2.2 A model of nuclear destruction in nucleus-nucleus interactions	37
2.2.1 Model formulation	38
2.2.2 Determination of free parameters of the model	39
2.2.3 Restrictions of the model	40
2.3 The g -particle multiplicity distribution	41
2.4 The Q_{zd} -distributions and other characteristics	45
2.5 Correlation between projectile and target nucleus destructions	49
2.6 Summary	50

3	PARTICLE PRODUCTION AT THE SLOW STAGE OF INTERACTION	52
3.1	Estimation of the nuclear residue excitation energy	53
3.2	The classical model of particle evaporation	58
3.3	Results and discussion	67
4	NUCLEAR MULTIFRAGMENTATION IN HIGH ENERGY NUCLEUS-NUCLEUS INTERACTIONS	70
4.1	Percolation model of nuclear MF	70
4.2	Analysis of α -particle multiplicity distributions in AA -interactions (choice of the type of percolation model)	75
4.3	The connection between the excitation energy and break-up probability (formulation of the calculation scheme)	80
4.4	Description of fragment multiplicity distributions in AA -interactions	83
4.5	Conclusion	85
5	ELECTROMAGNETIC DISSOCIATION OF NUCLEI IN HEAVY-ION COLLISIONS	86
5.1	Review of the WW approximation for Coulomb fields	87
5.2	Excitation amplitude in the semiclassical approach	91
5.3	Photon cross section	92
5.4	Applications	93
5.5	Conclusion	96
	Arabic summary	106
